This particular manual has of table of contents that is three pages long itself so you know it does have a lot of valuable information contained in it. If you are anything like me, you are not initially interested in spending a few hours reading through your G12 camera manual.

The reality for most people is that you dont need to study it like a textbook, but a quick read through will really give you an idea of all your Canon G12 has to offer. Modern digital cameras have an enormous amount of technology builtin and it makes no sense to buy a camera and not take advantage of all of its features. There are also some great nonCanon produced guides available for The Canon G12 written by professional writers so they well organized and are easy to understand.

Some user guides are poorly written but are still very valuable in getting a quick feel for what settings are available and how to make a few quick adjustments. The best feature of the G12 manual is the two pages before the table of contents. Page 4 gives you about 20 of the most popular types of subjects you may be interested in shooting along with the pages covering that topic. Page 5 gives you a quick list of options for Viewing, Video, Printing and Saving and the corresponding pages to visit in the manual. These two pages of the G12 manual provide a nice shortcut to tracking down these things without having to search within the full table of contents that follows. Not so much. There's a reason computer companies don't say much about the webcams that come built into the bezels of their screens. Most of these cameras are lowquality, with tiny sensors and cheap lenses. Sure, they work for basic videoconferencing, but they aren't very impressive and certainly leave us wanting something more.

You'll need a few workarounds to get this type of camera to be recognized as a webcam by your computer, but the trouble is worth it for the higher resolution, much better lowlight performance, and cinematic background blur. With major camera manufacturers like Canon, Nikon, Fujifilm, Panasonic, Olympus, and GoPro recently building a webcam option into their software, the odds are now pretty good that you can modify your current camera to use as a webcam, for free. If your computer has an HDMI port, it is likely itself an output port. And while cameras have USB ports, they generally do not send a clean video signal through them. The beauty of this setup is that you can generally use any HDMI source as the input, from a camera to a game console to another computer, and the output can be used however you'd like, from video conferencing to livestreaming or recording. Even if you have a camera that can shoot 4K video, the USB adapter may only support 1080p output. Given that most livestreams and videoconferences are reduced to 1080p or even 720p

anyway, this probably isn't a huge concern. Some of the top-ranked ones include It allows you to connect multiple cameras or other HDMI inputs and select which one to output to your computer, which will see it as a simple webcam. This allows for advanced livestreaming setups with different angles, sharing a screen from a tablet or phone, or even printed material via an HDMI document camera. Sure, you don't need that for your average Zoom meeting, but the ATEM Mini has much more flexibility than a simple HDMI to USB adapter — and it's not even that expensive. Otherwise, you'll stream everything you see on the camera screen, including the user interface overlays, like exposure settings and focus indicators. Each camera's menu settings will be different, but look for an option for "output display" or "HDMI info display." Consult your camera's user manual if you can't find those settings.

If your camera has facedetection autofocus or, better, eye detection, this is a great feature to turn on, as it will take all of the guesswork out of focusing. If your camera doesn't have this feature, you can use standard continuous autofocus CAF, although this may not be reliable. You can also manually preset the focus, but you'll need to make sure you don't move during the video. These software solutions are less universal than video cards, however. Thirdparty software is available, but as 2020 made working from home a necessity for many, several manufacturers launched their own native solutions. Canon, Nikon, Fujifilm, Panasonic, Olympus, and GoPro are all integrating a webcam feature into native and free software. Most of these programs are recently launched beta options but provide users a way to use their camera as a webcam without buying any additional accessories. Cameras should also have a full battery, while long livestreams may require an AC adapter to keep the camera fully juiced. Unlike using HDMI, USB doesn't provide access to the camera's microphone, so these software tools will still require you to use your computer's builtin mic or an external one plugged into the computer, not the camera. A safe place to mount your camera, like a tripod, is ideal. And while not required, you'll also get better results with a video light and an external microphone. You'll need to launch the webcam utility software and follow any steps there, and inside the app you plan to livestream with, you'll need to go into the settings and choose your camera instead of the default builtin webcam. Just like using an HDMI video capture device, you will still need to set the focus on your camera. Initially available for Windows only, a MacOS version was recently introduced that allows the cameras to be adapted to both operating systems. The app works with Nikon Z cameras, as well as recent DSLRs, including the D6, D850, D780, D500, D7500, and D5600.

The app, available for Windows and MacOS, works with several highend Fujifilm mirrorless cameras, including the XT2, XT3, and XT4, as well as all mediumformat GFX models. The cameras will show up in any videoconferencing app on MacOS or Windows as a selectable webcam. However, most camera settings — including exposure — will be locked on automatic, although you can use exposure compensation to make the image brighter or darker. The program is similar to Panasonic's earlier tethering program, but strips the overlays such as focus boxes from the image, giving a clean output suitable for use in videoconferencing. This beta software is compatible with Windows 10 and needs one of five more advanced OMD cameras to work, including the EM1X, EM1, EM1 Mark II, EM1 Mark III, and the EM5 Mark II. After installing the software and connecting the camera, users can select the camera as a device option in their video conferencing software of choice. To adapt the action cam for webcam use, the HERO8 first needs to have updated beta firmware on the camera itself. Then, install the beta program on your computer, and connect the GoPro with USB. The software is compatible with Mac OS, and a Windows version is in the works. As video conferencing grows, other camera manufacturers will likely follow suit with their own programs to adapt cameras to webcams. Sony, for one, plans to introduce webcam support for its ZV1 vlogging camera in July. SparkoCam is a Windows program that allows Canon and Nikon DSLRs to work as webcams without any special hardware check for full compatibility with your camera first. Unfortunately, it isn't available for Mac. With tools like multicamera switching, pictureinpicture, and screen sharing from

a Mac or an iPhone, the software is a more advanced option for serious users. Once you finish streaming, Ecamm Live can also save the video file to your hard drive.

The save feature is handy in various scenarios, but especially for anyone who's recording footage they plan to edit. But in most cases, the setup isn't exactly seamless. If you want to save, edit, or rewatch your video, a capture card is necessary anyway. So although monitor mounts may have their uses, you're going to need some kind of tripod. For videoconferencing, a compact tabletop tripod is probably the best way to go. We're fans of the Joby GorillaPod series and the Manfrotto Pixi tripods. You'll find both options among our picks for the best tripods. Adding an external USB microphone to your computer is a surefire way to improve the sound of your voice. Sound quality and reduced echo and background noise can make a difference for your video calls. Especially in professional meetings, background noises can be workplace hazards.
