Activated carbon msds sheet

motorcycle image by Goran Bogicevic from Fotolia.com Carbon fiber sheets are used for a number of purposes because of the material's strength and rigidity. Many automotive interior panels are custom made using carbon fiber sheets. However, they are expensive, as are professionally manufactured carbon fiber sheet blanks. Carbon fiber cloth is more expensive than stock fiberglass cloth. However, the cost of making carbon fiber sheets is far less expensive than buying them already made. Use carbon fiber cloth, epoxy resin and a few fiberglass techniques to make professional quality carbon fiber sheets at a substantial discount over professionally manufactured panels. Cut two sheets of Mylar two inches larger in length and width than the carbon fiber sheet being created. The carbon fiber and resin will be sandwiched between the two sheets of Mylar, allowing for a completely smooth and glossy finish without sanding or polishing Cut the carbon fiber cloth one inch larger, in length and width, than the required sheet size. Prior to cutting, make a border of painter's masking tape around all four sides of the carbon fiber cloth. The masking tape border will prevent the carbon fiber cloth from becoming distorted (which causes it to lose its uniform pattern and strength). Use a sharp utility knife and a metal straight edge to cut the carbon fiber cloth to the desired sheet size. Lay a sheet of High Density Polyethylene (HDPE) down on a completely level work table. The resin needs to be applied on a level surface to avoid creating a carbon fiber sheet that is uneven. Use 1/8-inch thick HDPE for this project. HDPE is a form of plastic that epoxy resin will not adhere to. The HDPE sheet should be three inches larger than the carbon fiber panel. Place a sheet of cut Mylar on top of the HDPE sheet. The Mylar will encase the resin and carbon fiber cloth after it is applied, creating a flat or smooth surface that appears polished. The Mylar eliminates the need to sand and polish the carbon fiber sheet's surface after the resin dries. Mix the resin in a plastic container. Use a one-to-one ratio epoxy resin. Epoxy resins are made up of a resin and a hardener. A one-to-one ratio means that equal amounts of resin and hardener are mixed together, which reduces the chance of any mixing mistakes. Using a medium-sized bristle hair paintbrush, apply a thick layer of resin to the Mylar laid out on the HDPE sheet. Carefully lay out the carbon fiber cloth on the resin, smoothing out any wrinkles or creases. Once the carbon fiber cloth is laid out on top of the resin, apply another thick coat of resin on the exposed side of the carbon fiber cloth. Take the second sheet of Mylar and place it on top of the wet resin. Smooth out the Mylar, removing any air bubbles in the resin by using a squeegee and pulling it gently across the Mylar's surface. Allow 24 hours drying time. Peel the Mylar off of both sides of the carbon fiber sheet, after gently pulling the sheet off of the HDPE. The resin under the Mylar will have a finished look without the need for sanding and polishing. The carbon fiber cloth has now been solidified, using resin, into a carbon fiber sheet. The project is complete. Download as PDF [PDF – 179 KB] Carbon monoxide (CO) is an odorless, colorless gas that kills without warning. It claims the lives of hundreds of people every year and makes thousands more ill. Many household items including gas- and oil-burning furnaces, portable generators, and charcoal grills produce this poison gas. Following these important steps can keep your family safe. CO Detectors Install battery-operated or battery back-up CO detectors near every sleeping area in your home. Check CO detectors regularly to be sure they are functioning properly. Oil & Gas Furnaces Have your furnace inspected every year. Portable Generators Never use a generator inside your home or garage, even if doors and windows are open. Only use generators outside, more than 20 feet away from your home, doors, and windows. This part is critical since it is what keeps your filter from falling apart, so cut and glue well. For the edges of the walls, I used 1/4x1/4 inch strip of balsa. To support the middle, I used 1/8x1/4 inch strip of balsa. Next, make 4 of both the inside and outside walls. You may need to cut some small squares of paper to stick in the corners for extra support. After the walls dry, lay the window screen out on wax paper. Apply a thin strip of glue to one side of each wall and place onto the window screen. The wax paper will keep the glue, which will run through the screen, from sticking to your table. After the glue dries, cut each wall away from the sheet of window screen. Next, cut a 45 degree angle in two sides of the wall so that the four outside and four inside walls can be joined to each other. Make sure that the window screen is on the outside of the square. In the end, you should have two squares with four walls covered and two left open (for the top and bottom of the filter).
