Php array index

Php negative array index. Php unset array index. Php check if array index exists. Php reset array index. Php get array index. Php get last array index. Php foreach array index. Php get array index by value.

There are few people who claim that the standard PHP API documentation website is beautiful to look at, but there is a better version that you can use today. Take the regular URL for the Strpos function, and you will see: now, and the prototype as sub-domain on the URL, http://prototype.php.net/manual/1/function.strpos.php and a much more readable page is displayed: the PROTOTYPE PHP site has been active and operational for at least six months now, and I am beginning to curse the days when I keep looking at the old version of the site when the new work was already available and is much better. Quick links on the right side will be particularly useful for moving in API documents.

PHP's postgresql extension provides a full API for developers to interact with a RDBMS PostgreSQL. In addition to basic SQL operations, the API also supports prepared statements, transactions, table metadata recovery and server variable inspection. It's not a secret that PHP and MySQL are good together. Both php and mysql are open source software, so it is not surprising that they have a similar community. The PostgreSQL community is also very active and growing. There are many commercial products. This tutorial will introduce PHP Postgresql API and show how PHP can connect to PostgreSQL databases, save and recover records, inspect PostgreSQL Server Variables and retrieve information on the table. Before launching in the tutorial, I want you to know about three hypotheses I'm doing about you and your development environment: you know the basics of SQL and PHP. You have installed a RDBMS PostgreSQL and is active in your development environment. If this is not the case, you must download and install a version of PostgreSQL that is compatible with the operating system. You have a running Apache Web server with support for PHP 5.1, and PHP build has support for postgresql extension. If this is not the case, you will probably need to recompile PHP with the '-with-pgsql' option (UNIX) or activate the appropriate file extension (Windows). The PHP manual explains how to accomplish these tasks. Prerequisites We set out the basic table that I will use in the following examples. Start by creating a new database called Test: `Postgres @ Thor: ~ $ /usr/local /pgsql /bin /createdb test`. Next, start the interactive PSQL shell and create the following table: `Postgres @ Thor: ~ $ /usr/local /pgsql /BIN /PSQL Test Welcome to PSQl 8.2.3, the interactive terminal PostgreSQL Type: a copyright for distribution terms A A A A h for help with SQL commands A A A A ? ForWith SQL commands i, /, A, & e erends with the point and comma to ask the question TABLE CREATA Countries (# NULL, NULL, Postgres # CountryName VARCHAR(255) NON NULL, postges # PRIMARY key CountryID) postges(#): CREATE TABLE postges=# Then, add some records to the table to get things rolling: Postgres @ Thor: ~ $ /usr/local /pgsql /BIN /PSQL Test INSERT INTO VALUE countries ('AS', 'Antarctica'); INSERT 1 postges=INSERT INTO VALUE countries ('AG', 'Antigua and Barbuda'); INSERT 1 postges=INSERT INTO VALUE countries ('AO', 'Angola'); INSERT 0 1 postges=INSERT INTO VALUE countries ('AI', 'Anguilla');
