Intake the computer screen to your WellbeingEt your photos online with photo: License: Trial versionEveloper: Power Software Ltd Twenty years ago This month Microsoft has released a bomb smells of an operating system, Windows Me. Unstable, Agrovred and Unusable, it was Windows Me. Many people believe it was the worst version of the windows ever built. The anniversary made me think: was Windows really the worst windows, or has it been exceeded by other remarkable flops? I used every version of Windows since Windows 1. x version that has been sent with the Aldus PageMaker desktop publishing program (after Adobe PageMaker), so I had a lot of experience with the best and the worst windows. Here is my list of the worst three versions of Windows of all time. I offered them in order of ascending horrorbility, so you'll have to wait to get to the bottom of the article to find the worst of the worst. Please! Start Second Runner Up: Windows Memrosoft has brought out Windows ME (Millennium Edition) in September 2000, even if seven months before, in February, he had already released another windows with a millennium name, called Windows 2000. Because two versions of Windows in a year? As Windows 2000, which originally would be destined for both consumers and business users, is over to be just for businesses and based on Windows NT. Microsoft wanted to make sure that consumers had a millennium operating system to call his own. Microsoft should not be disturbed. Windows Me was a horrible piece of work, SlapDash, incompatible with lots of hardware and software. Impossible frequently during the installation process Â € â,~ "which should have been the first sign for people that this was an operating system that should not try. Often, when you tried to turn it off, he refused to do it, like a child Two years of launching a whim to be forced to go to sleep. It was slow and insecure. His web browser, Internet Explorer often refused to load the web pages. I also introduced the restoration of the system, designed to allow you to Return to a previous instantaneous Windows if you have had problems. Unfortunately if I had a virus at that restore point you killed, the windows would also rename the virus. There are too many other questions to enter here, but the operating system was like this ~ ugly "that people started calling it Windows Errition Edition (ME), instead of Windows Millennium Edition.First Runner Up: Windows Vistaah, the special type of quellettes Â was Windows Vista. Released in 2006, five years after receipt of Windows XP, Vista was born under a bad sign, Jinxed from the beginning, intended for failure. Working on it started five months before release Windows XP. It should only be a minor XP update, to be released in 2003, a stop of sort before a larger Windows update that was in "Blackcomb." But the developers will be developers and soon many of the new technologies and features designed for Blackcomb Thanged their way into view development, slowing things drastically and lead to chaos and confusion during the of development. Microsoft Co-President Jim Alchin, then manager of the windows, admitted to a magazine Wall Street Journal article on September 23, 2005 that the development of the not yet released view was Â € â,~ Â "crashing in the ground". This could do it exactly What happened when Vista was finally rolled up in 2006. I don't have enough space to tell the maximum maximum measure As it has been Bad Vista, but start with the introduction of a feature called intensely annoying user access control (UAC), which forced people to confirm that yes, they really wanted to change a particular setting or use a specific program. It was a constant nag, that required to terminate your job to make it as simple and basic things like the disc open defragmenter.Vista was also notoriously unstable. It would not work with numerous devices, including many popular brands of printers. But all that Pales in comparison with a very large hardware issue - the operating system has simply refused to run, or ran so bad that it was useless to countless PC. Not only the old PC, but also the newly purchased PC, right out of the box with Vista installed. There have been several versions of Vista, and the consumer version of Vista has been delayed until January 2007, after the shopping season of 2006. Microsoft vacation worried that people would not buy Windows XP PC during the holiday season if they knew that the PC would not run Vista when the operating system was released in early 2007. So Microsoft has cooked a scheme to put Â € â,~Â Windows Vista Capable PCA € â ~ stickers on XP machines , in hopes that people would buy them while shopping holiday. There was only one problem with that pattern of bait-and-switch. Many Â € â,~Â Windows Vista Capable PCS PCSA € â ~ Werena Â "It is not in fact capable of running Vista, something that even Microsoft executives admitted to each other in Private.a Class Action Suit against Microsoft was launched as a result. The emails by top Microsoft executives Scoperted during the suit have been very destructive. Mike Nash, then a corporate vice president for Windows product management, wrote in an e-mail, "I personally burned ... We're seeing many customers? ... I now have a \$ 2,100" for e-mail machine. Jim Alchin, a member of the company's senior leadership team, wrote in an e-mail, "We really did this ... vorniti do a better job with our customers." And an employee of Microsoft Unnamed unchanged in via e-mail, "even a piece of junk will qualify" to be called Windows Vista capable. All in all, Windows Vista was as bad as it gets. Although not as bad as it gets, thanks to our winner. The bad evil: Windows want badly? Want to fool? Do you want an operating system that not only was concluded in a concrete way by consumers and companies alike, but also set the years of the business plans of Microsoft, then Windows 8 was Windows for you. If you want a useful and solid operating system that has made it easier your life to your PC, you have to wait very wrong Windows 10.So the worst operating system Microsoft has created that it is difficult to know where to start. Let's start with the easiest. It was not really a single operating system, but rather two separate oss heavily bolted insieme.On was built for touchscreen mobile devices and would run applications built for Desktop apps, Win32 as an office. That part of the operating system has been designed from the ground up to work by touch, not by the keyboard. It was also designed to run apps that Microsoft through the years called Metro app, universal applications for the Windows platform, Windows Store app, and now, only Windows app. The other operating system in Vista was one that had been around for years, with a desktop app and Win32 and all that went with it. This is the operating system most used, because © when Windows 8 was released, there were a few bars of Windows. But in Windows 8 they have all been forced to live with And the limitations of an operating system designed for TouchScreen Tablet.Persone were forced to fight with a useless boot screen designed for the mobile rather than the desktop. And they were forced to move forward and backward between a traditional desktop and starting screens.as for those metro apps, they were significantly sub-starter, to the point of being useless. They could not be reduced, so they took the whole screen, screen, Win32 app. And there were hardly available. At the time, I wrote that the Windows store, from where you download them, has been "sterile of goods as a Romanian grocery store during the depths of the Ceauã regime ... Â €Scu.Â.A." Many of Windows 8 problems They are due to the Microsoft decision to use it as a forced object to become a mobile power. At the time, Windows Phone there was an abject bankruptcy and Microsoft seemed to make a splash in Tablet. So he decided to build a built operating system of more for mobile than the desktop. And he decided to create metropolitan apps that theoretically one day they would also work on the Windows Phone. This all-in mobile approach on Windows 8 has led Microsoft to buy mobile business for \$ 7.2 billion of dollars for \$ 7.2 billion closure down for that business. Microsoft spent years trying to succeed in the mobile phone, depriving the rest of the company of resources, money and time. It was not until Satya Nadella was hired as CEO and changed the company focused towards the cloud and away from the mobile phone and Windows that the company started to recover from the Windows 8 disaster. Go more to view other windows like Windows 8? It is not likely with Windows 10, Microsoft no longer makes drastic modifications to Windows. What you see today is what you will see tomorrow and for a long time in the future, with only modest changes along the way. So Windows 8 will probably have the wreath of the worst windows ever, throughout the time there is Microsoft. Copyright © 2020 IDG Communications, Inc. Inc.
