Even where the Ion has healthy edges, it's superior in usability and possesses wealth for competition. In the months we have used Ion the robust script feature has been supported. Each update increases usability and functionality, although it sometimes comes with some workflow changes. I can recommend this software unreservedly. It's good now with the potential to be great. I have had a very good experience with the First Resonance team and believe that they are an excellent team to work with. The traceability, work instruction and building ticket mobiles work well and provide the necessary functionality. Ion's team is very responsive and actively adding features. They provide real-time support on both usability bugs and concerns. The front interface of the software is very functional. Configure and scale the software is easy. The First Resonance team facilitates export control compliance. Minor program errors are not uncommon when working on the tool. The data entry of our PDM system is manual and time consuming. The lack of strong mobile support is a significant opportunity for the software, but a frustrating omission at the moment. Page 2Get advice at free4 out of 55 of 54.5 out of 53.5 of 5 Great UI, intuitive design, responsive staff consistently rolling new features, first in class integration platform. This product is very easy to use. I believe that when we roll this over to more of our team, it will be simple. Extremely intuitive software that helps our company track and manage workflows. My current struggle with software is something I know the First Resonance team is already working on - the feature of import pieces. I was extremely disappointed with the customer service of the team. After receiving our help, so we were doing before. Ion has only the resources for the development of work tools quickly. It's very easy and intuitive to use. I like the data field collection option that Ion provides that helps better track the data inputs that need to be captured while running processes. So am I, I think the nesting step functionality. And help organize the work instruction much better, hello in the functionality of dependencies. I feel that some of the field validations of data are not fully developed. The minimum values / max can be entered by mistake and, resulting that operators using the work instrument may not be able to correctly capture the process data. Many times there are insects when new tools are released and, although these are usually quickly fixed, lessens operators when performing the work. The functionality of editing by creating work tools can use much improvement. Easier to set up. Ability to customize our development of MES work and system instruments with the first resonance team. The interface is simple and the software is usually very easy to navigate. Create items and procedures and I can generate work requests without any problems. The first team of resonance Response and updates are often discarded, so issues that I can have a week can be resolved next. Always good to wake up to new features and have an evolving interface. Seventh. Create service items or orders Easy enough, but come back and find work that was done previously not an easy task. At the moment, this usually consists of rolling over long lists. The search bar too much of a little. and the queries need to be precisely defined, otherwise they go back to a long and long list. Also it is not apparent what is happening in the ion backer and it is easy to hinder links between items that are linked (this is very fragile). On brought great value to our company. It is very easy to use and configure. Customer service is incredible! The staff actually hears their feedback to improve the product. If we can not do something, you need it now, it will probably be added or there is enough work. Highly recommend using Non! On is super easy to set up! You can go with it within a few days and immediately cause impact on your production workflow. Having your work instructions directly in the software and no other system is a great benefit. The ability to track the good and collect the data as built during the execution of executions is extremely valuable. There are some cases of border and bugs that still need to be solved. There are some features that are as in application relatives, but there are good solutions until they have the chance to implement it. Material consumption for 3D printing applications needs to be improved. We were decently early adopters with weak and we saw software grow in an increasingly powerful toolbox. Will revolutionize the field of work instructions and inventory management. The support team is knowledgeable, useful and easy to work. While working with the staff, it looks like they are part of their internal team when finding solutions inside the Ion. The price seems to be a bit aggressive for the software when compared to alternatives. The price by usager maintains the software to be fully adopted by the company to find solutions of their own. Prodsmart did not have a US engineering support team. I really appreciate the attention to detail, the first resonance team dedicates the customization of our interface of ours. The clean interface, integration of the Container procedure, and execution / problem resources are just a few of the features that make my team work fast and efficient. It took a long time for the team to integrate on into our everyday start-up life and more grows with us as we scale production. My current struggle with the software is something that I know that the First Resonance team is already working on - the import parts feature. If we had a check page or import history implemented for the software, it could help to minimize the related confusion whether an item line was imported correctly. I will relay an addition to this customer request to Ion's support. Ion has been a real partner for us and... very sensitive to our feedback. I love that this is a simple, cloud-based solution for the execution manufacture, which does not have much swelling! Much of the central functionality is there, as I am craving some usability functionality as best organizing and filtering races, better tracking to different workcenters, and some "quirk-reduction" like there's a lot of little things you just need to know how to do or how to massage the system. I found that documenting my processes usually slowed me down, we need to find a better way to use Ion in the prototyping and R&D phase. an unique tool that solves many problems that have bothered me all my career, writing procedures, releasing them, revising control and tracing data related to the construction product. I love that First Resonance is highly sensitive to users'and aid requests, and has the vision to help companies like ours to make control of the manufacturing process easy. I would like the FR to do a little more testing on new features before pushing them into beta groups. I might as well have access to Jira from FR if we're gonna write bug descriptions so many times. A good working experience will dramatically increase the efficiency of the software as well as better/better hooks to import BOM from a project. Extremely intuitive software that helps our company keep track and manage the has a difficult time rendering images and would benefit from an API that could allow users to automate specific tasks. Very clean. Clean. The First Resonance also has been extremely receptive to feedback, even for new features that may take a while to implement. It is clear that this software is in its initial stages, but getting feedback and responding to it is a great way to improve. There are many improvements that need to make these software productions ready. The instrumentation editor is still very irritating to use when incorporating images, sorted list, and any non-basic training needs. I wish there was an option to create a field that can take several entries. I never tried to use the tracking and traceability part in ION, but from what I saw it doesn't seem ready to go. I would like to see the devs make more controls for improvements/changes bearings. Sometimes I feel that things unfold very quickly and result in many flaws in implementation. I love that First Resonance receives our feedback and continuously updates their software to meet our needs. It's also much intuitive to most of what is a bonus. The software can be quite buggy sometimes, what is Understandable how it is still developing. It would be only if the suggested changes were implemented in the data network structure soon. The data grid will probably be the most used feature in the whole company and needs to be alone. Simple

enough to use in broad application scenarios. Simple, easy to use. The options for checking that are very rich and very useful resources. Some weird UI stuff, but nothing is © River. They'll be worked on in time. Custom features and support 1:1. THE UI © Easy to understand. Easy place to follow the completed work and in progress. Lack of ability to connect different races that could help move from one race to another without the use of going back to the execution table. © Easy to create new races and as well as the usefulness of racing. I also © appreciate how receptive to team feedback is© and how quickly they implement changes to make the software better. My My The complaint © there is no way to see the story of a piece. We often make an assembly, we use it, then we take it down to use the pieces elsewhere. When we try to go back to see where this part was used in the past, there's no way to find out. This product © very easy to use. I believe that when we do this for more of our team, it will be simple. Questions to the ION team © are also answered promptly and all requests seem to possibly promulgate. As a more recent user, there's not much I've found to be unexplainable at this point. The only thing that poses a challenge is © the need to update a purchase order after placing it, instead of updating in real time as I said. The software simplifies and improves the quality of our procedures with a simple movement based on clicks© through the procedure when your hands are busy There are still some small bugs that can be worked out that are expected with new software. Great software and support, will be rolling it out in any organization the following year. Great user interface, intuitive design, responsive team consistently rolling new features, first in the class integration platform. Some robust features found in similar enterprise systems are not yet available. The heavy focus on data and medical ©, and features like 'Trace, show ion's value for quality as well as manufacturing departments. The development team is © and values and uses its suggestions to improve the program. As is still under development, some features do not exist and others are not yet fully disposed of. Very responsive customer service. Intuitive and easy software to implement in our workflow. Since the software is still being developed, there are many areas of improvement, so the capabilities may be a little lacking in the First Resonance's team however is very receptive to recommendations, and implementations occur quickly. Procedures and Runs. I like how we are able to have a common place and format forThings. Creation of parts and list. It's clumsy and I'd rather we have one. Manufacture buildings, procedures. Easy to start and create procedures. Basic traceability process in place. Search function. Trace materials not confirming. No annoying person bothering me with product complexity. Irritating beliefs. Using Ion to dictate the workflow certification is proving to work very well with our timeline speeded up. We got fans, © that integration continues t o flow as easily as it has been until © Now. This is © my fist time working with software tools o f work and I found it very easy to learn and integrate with our manufacturing processes in development. Incorporating this software with all our other software was challenging, but Ion team © Very helpful and responsive. The FR team © Incredible and really helpful. Highly responsive and very familiar with the software. The software © the highly useful to set up tracking, mfg documentation and build tracking. It's the bridge between manual tracking and an expensive PLM system. The product was not the question, it was the wrong time. Presenting a 28-25 revisions s4. 04/5 of reviews of 28
