Why am i not getting all my freeview channels

solve a problem problems watching programs on freeview? What do I need to get freeview play? the number of freeview channels available to your address depends on the transmitter from which you receive your signal. depends also on your equipment – for example, if you want hd tv then you will need a hd device. to check which channels are available at your address just enter your postcode into our freeview channel checker. He'll tell you where the nearest transmitter is. how the freeview scammer works the freeview channel checker gives a good indication if you will be able to receive freeview and which channels you will get. but remember that it is a prediction based on an area of 100 square meters around your address. there is a small possibility that some addresses in that area cannot receive freeview because of their exact location and other elements of local geography, such as tall buildings, trees or hills. There are some reasons for this. not all freeview channels have their own apps, and even if they have one, they may not have live content to which we can connect. not all programs are allowed to be transmitted via mobile. We are working on this, however, and will let you know when we brought more partners on board. What could we do better? It's great, what did you like? lg 50pk350 tv w/built in freeview communal aerial from what I can collect are on the transmitter of winter hill. I just set this for freeview as we have sky+ hd aswell, but its currently faulty. I scanned for channels, its 37 TV channels found and 19 radio channels. I wonder why I would not have received the following channels, do not appear on the epg itv3 sky 3 qvc dave channel 1 bid tv dave ja vu E4+1 fiver five united states of america big deal ITV2+1 (however this is on the epg as ITV1+1) price drop tv quest citv sky news teletext holidays skyTV Sky3+1 Community Channel Talksport Capital FM Premier Radio Christian Absolute Radio Cuore FM FMchannels appear in the Freeview Winter 2010 TV Guide PDF but are missing from my EPG. Does anyone have any idea why and being able to offer advice? On this page we offer some practical tips about dealing with missing Freeview channels. - First of all, click on one of the following to describe your problem: Don't you have all the Freeview channels? Freeview TV channels are broadcast on six different "blocks", known as Multiplexes. If you are able to get some channels, but not others, it might be that you are having a problem with one or two of the multiplexes: PSB1 includes: BBC1, BBC2, BBC3 PSB2 includes: ITV1, Channel 4, Channel 5 PSB3 is for COM4 HD channels including: ITV3,Home, QVC, Top Up TV COM5 includes: Pick TV, Dave and really COM6 includes: Yesterday, Film 4, Viva Discover which multiplex you are not receiving, then read. There is a complete channel and a multiplex list here: Display channels Things to control: 1. Channel scanning The Freeview line-up channel and channel numbers change now and then. From your Freeview or digital TV box, go to the menu and search for a "Scan for new channels", "Add channels" or "Auto-tune" and scan for channels. If you are not sure how to scan channels, look in the manual. Scanning aid for channels 2. Check Freeview coverage Are you able to get all Freeview channels where you live? Not all UK can still receive all Freeview channels. Check that all Freeview channels are actually available in your area, using a postcode checker. Enter your postal code on www.freeview.co.uk/availability Please see the "Freeview coverage" section to help. 3. Relay transmitter? > Do you take your Freeview from a small local transmitter? If so, you can not be able to get all the channels. About 90% of UK homes will be able to get all Freeview channels, but there are some houses thatthey rely on a 'relay' transmitter for their Freeview signal. Relay transmitters are often used in small rural areas where signals fromLarger transmitter are not good - typically where the signals are blocked by hill or mountains, or where the houses are in a dip or valley. The smallest relay stations updated for digital passage are able to broadcast only three of the Freeview multiplexes, those of Public Service Broadcast, so that those who use a relay transmitter will be able to see services like BBC One, BBC Two, ITV, Channel 4 and Channel 5, but not channels like Dave, Sky News, Yesterday and Film 4. 3. Check other air chambers/connectors If you have more than one Freeview receiver, and/or more than one air point in the house, try some experiments If the problem is there for all air points and Freeview boxes, then it could be signal coverage, a problem with your aerial, or a problem with air wiring booster If the problem affects only one room or a receiver, then it could be an internal wiring problem, or interference, which can often be solved. Many Freeview boxes and digital TV sets allow you to see a signal strength screen display. If your signal is weak, but you are destined to be in a decent signal zone, then indicating a potential problem with your aerial, or a problem with your wiring. In some cases a signal booster can also help improve a poor signal. 5. Check your wiring If you have a lot of aerial extension cables, dividers and adapters, this can affect the signal quality. Using long extension cables can also affect the signal. 'Looping' your air feed through a lot of equipment, such as video or DVD recorders can weaken the signal too. Give your receiver the best chance to get a quality signal - consult our wiring board to eliminate any weak connections in your wiring. Often it is worth trying a connection ofbypassing all extension cables, splitters, recorders, etc. Connect the main house antenna directly to the Freeview receiver - if a basic connection works, it could indicate a wiring problem. 6. Could be something.with your signal? There are several factors that can affect the signal and cause interference, including wiring problems, weather conditions, household appliances, taxis, passing car, scaffolding, etc. Normally this is referred to as image breaking, pixelation or sound loss, but it can cause you to lose channels if it is particularly bad Go through the steps in our interference page if you suffer from this. 7. Are your neighbors affected? It might be worth checking if your neighbors are hit. If they can get the channels you miss without a problem, and their air is pointing to the same transmitter, which can confirm that the problem is with your air or air wiring. 8. Check the transmitter issues Check if there is a transmitter job in your area that might interest you. The BBC has a convenient transmitter maintenance page. I don't know which transmitter is closer? Look at Wolfbane.com 9. Is your plane good enough? To get the best results, you need a good quality roof antenna, pointing to the appropriate digital TV transmitter. Internal air: Series-top internal antennas and air lofts are often not up to work For aerial advice, see our air section. If you discover that you can't receive channels on a certain multiplex, there is a chance that your airliner is unable to tune into some of the Freeview signals. Checking the missing band multiplex is in (using Wolfbane.com.) and check if the antenna is designed to work with that frequency band. It could be that Freeview channels are outside that band - For more on this, see our Aerial Group section. 10. Could your other TV kit block your signal? Some equipment, such as video recorders and Sky digiboxes use something called modulator to transmit a signal that equipment like a television canIn some cases, the channel number used to modulate on (a number of 21-68) can be the same as one of the Freeview multiplex channel numbers. Freeview.try if there is a possibility of this, try to remove other equipment - making the connection as simple as possible. Connect the TV antenna to Freeview box, then a SCART to the TV (cutting other boxes and video recorders). If the missing channels appear, then it could be a channel clash and it could be necessary to re-unite the modulator to a new channel. 11. Could your signal be too strong? If you live near the TV transmitter, you might find that the Freeview box or TV is getting too much signal and this could be 'overload' your receiver. If this is the case, you may need to get an air attenuator. These plugs in the air socket and reduce the signal coming. In addition, if you need a signal booster before the Digital Switchover, you no longer need this, and should experience the removal of the booster to reduce the signal. Can't you still get all the channels? Ask for more help Freeview channels suddenly vanished? Suddenly lost some or all your Freeview channels? It is possible that there is a defect to the local TV transmitter, but more likely, it is something in the house - wiring, problem box, plane, etc. Here are some tips on what to control. 1. Check the air connectors and restart Check that the antenna is properly connected to the Freeview receiver. If possible, make a direct connection to the TV antenna (i.e., adapters or loops through other TV equipment). In addition - reset the receiver - If you use a set-top box Freeview, turn it off to the network for 30 seconds, then turn it on again. 2. Channel Scan The Freeview line-up channel and channel numbers change now and then, and you may need to update the channel list. If a channel is missing, is it no longer on the air? In addition, occasionally the channels are renumbered, they are renamed, or moved intodifferent channel block (known as multiplex.) controls our list of freeview channels and also displays our freeview news page for freeview updates. If it's just one or twothat are missing, you can find that you need to get your Freeview box or TV to restore for Freeview channels. This means that it will look for changes to the training and update the list of channels. To do this, go to the menu on the screen and search for a "Scan for new channels", "Add channels" or "Auto-tuated intonation". Sometimes, you may have to try this a couple of times, or reset the box before. Need help with rescanning? 3. Others in your affected area? Are your neighbors affected, too? There is some work transmitter in your area that might interest you - check the BBC transmitter maintenance page to see if there is something that is affecting your local transmitter. I don't know which transmitter is closer to you? Check by entering your postcode on Wolfbane.com 4. Try a second receiver If you have more than one Freeview receiver in the house - check if the channels are missing even on a second receiver. This can help identify the problem. If you try two receivers on the same air connector and both have the same problem, then it is a signal or wiring problem, not a box problem. If the box works in a room, but not in another room, then it might be a problem with wiring for that room, or that the signal needs to increase to that room 5. Just an interested box? If it is just a Freeview receiver that is interested, and others in the house are OK, then check the air wiring to make sure everything is fine. It could be that if you are dividing the signal to multiple TV sets, you are experiencing "sign loss" through the wiring. An enhanced splitter can help in these situations. See our Boosters page. 6. Air problems? Any chance of air damage? The rain in the air cable, or the wind that displaces your air will have an effect on the quality of the signal. It's worth thechecking your airline is where it should be, and that the air cable has not been damaged. 7. Harness issues? Check the route from your aerial to your receiver: Could have partitionsif you have a signal booster, was it uncompromised or no longer works? Your airstrip was disgraced, chewed by a dog, cut? if in doubt, try a basic connection. connect the antenna to the receiver, then receiver-to-TV (passing any other equipment, connectors, splitter or booster.) 8. How's time? storms, heavy rain and snow can affect the signal. some of our interference tips can help if this affects the view regularly. 9. control the interference there are several factors that can affect the signal and cause interference, including wiring problems, weather conditions, household appliances, taxis, passing cars, scaffolding, etc. normally this is indicated as image breaking, pixelation or sound loss, but can cause you to lose channels if it is particularly bad if you suffer from this, take steps on our page "freeview interference." do you need help? if you have tried tips above, and are still missing freeview channels, try the following: ask for help in our freeview problems forum - please include your post code, the channels you lack, in addition to the make and model of your freeview receiver, as this helps the regular forums provide relevant advice. it is also useful to list what you have already tried. Alternatively, contact an air installer approved by the local cai and let them take a look at your setup and measure your signal strength - can help with appropriate recommendations.
