Cisco router 1941 configuration guide

Features of architecture: Modular Platform • The Cisco 1941 ISR series are highly modular platforms with multiple modules slots to provide connectivity and services for different network needs of branches. ISR offers a wide range of industry-leading LAN and WAN connectivity options, through modules to accommodate field updates to future technologies without requiring platform replacement. Processors • The Cisco 1941 series is powered by high-performance multi-core processors that support the growing needs of branch office networks supporting high-performance WAN requirements. Multi-Gigabit Fabric • Cisco 1941 introduces an innovative Multi-Gigabit Fabric (MGF) that allows you to effectively communicate the module, allowing direct interactions of services between modules, while reducing overload on the router processor. Integrated VPN hardware acceleration • Built-in hardware encryption acceleration is improved to provide a higher scalability, which, combined with an optional Cisco IOS Security license, allows security and VPN connection services (IPSec acceleration). The encryption hardware on board exceeds the advanced integration modules of previous generations. Integrated Gigabit Ethernet Ports • All WAN ports on board are 10/100/1000 Gigabit Ethernet WAN ports on-road. • A new, innovative and mini-B USB console port supports management connectivity when traditional serial ports are available. • The traditional console and auxiliary ports are also available. Both the USB console and the RJ-45-based console port can be used to configure the router. Optional integrated power supply for power distribution on Ethernet (PoE) • An optional internal power update provides power in line (802.3af-compliant Power-over-Ethernet [PoE] and Cisco standard in line) to optional integrated switching modules. Integrated wireless LAN • The Cisco 1941 offers a secure integrated access point in one device. • The integrated access point is based on the IEEE 802.11n standard of the 2.0 project using MIMO (Multi-Input, Multiple-output) to improve coverage for existing 802.11a/b/g clients and new 802.11n clients. • The Cisco 1941 supports two radios – 802.11 b/g/n and 802.11a/n and is able to operate both in autonomous and unified mode. Cisco 1941 setup:Some FAQ for ISR G2 in particular Cisco 1941: (The material is from: cisco.com/en/US/prod/collateral/routers/ps10538/qa_c67_553891.html) Q. What wireless LAN interfaces are available? A. Cisco 1941 has a factory option to add an 802.11n Wi-Fi interface – this platform becomes Cisco 1941W. You can configure the wireless LAN interface as a standalone access point or as a component of a unified wireless infrastructure. Cisco 1941W is available in four specific variants of the region that comply with various local wireless regulations (part numbers 1941W-A/K9 for FCC, 1941W-E/K9 for 1941W-P/K9 for Japan, and 1941W-N/K9 for Australia and New Zealand.) The new Cisco 2900 and 3900 integrated service routers also support the Cisco wireless LAN controller network module for access point control using the Lightweight Access Point (LWAPP) protocol. Supported LAN wireless control modules support 8, 12 or 25 access points (nME-AIR-WLC8, NME-AIR-WLC12, and NME-AIR-WLC25). Q. Do Cisco 1900, 2900 and 3900 Series routers have security certifications? A. The following certifications are underway: • Federal Information Processing Standard (FIPS-) FIPS 140-2 Level 2 and FIPS 140-3 Level 2 • Common Criteria/Evaluation Assurance Level (EAL-) PSC, FW, SSLVPN and IPS Q. A. Yes, there is the equality of security functionality between current and next-generation integrated service routers. However, for next-generation routers you need to purchase a security license to distribute any security features. Q. What kind of licenses are available for Cisco ISR G2? A: • Permanent: a permanent license never expires. When a permanent license is installed on a system, it is good for that particular function set for the life of the router, even through the Cisco IOS Software versions. For example, when a unified, security or data communication license is installed on a system, the following features are activated for this license even if the system is updated to a new Cisco the release of software. a permanent license is the most common license type oato when you buy a feature set for a device. • temporary: a temporary license, sometimes referred to as an evaluation license, is good for a limited amount of time. all new integrated service routers include a full set of 60-day temporary licenses for data, unified and communications security feature sets. you can turn on and off these licenses at any time to evaluate a set of features before making the decision to purchase and update a permanent license. you also have some flexibility when you need to upgrade to a permanent license. only the time when a temporary license is active is counted against the time available on the license. When a temporary license expires, you can't extend it. However, in extreme cases, the cisco technical assistance center (tac) can issue new temporary emergency licenses to help in troubleshooting. • count: a license counted actually counts something in the system. a typical example is the number of possible ssl vpn connections on a system. These licences are similar to the numbered paper licenses used with systems in the past. However, the new software activation infrastructure significantly simplifies the management of these licenses. • subscription: a subscription license allows access to a function or capacity for a given period of time unless the subscription is renewed. subscription licenses generally concern regular updates a third-party service as a content filtering license, which provides regular updates from a filtering database. Q. Are trust-based licenses available on new integrated service routers? A. Although the primary license and functionality activation method for new integrated service routers is Cisco Software Activation, trust-based licenses are still provided for some features. These trusted licenses will gradually be out of time and replaced by Cisco Software Activation Feature Licenses. This approach gives you even more flexibility in how you can configure and pay for the features in the network, how the new platforms are introduced, as well as how you adopt software activation licenses in the network. Q. What licenses are available on the Cisco ISR G2? A. Technology packages licenses, software activation licenses (to the first shipping customer [FCS,]) and licenses for use-right functionality (to FCS): • Technology package licenses are delivered with new systems; are also available as an update through the activation of Cisco software. • Software activation licenses are usually updated to one or more technology package licenses; can be included in new systems or updated via activation of Cisco software. • Feature licenses from right to use follow the traditional license model and do not use the activation of Cisco software. You can order when buying the system or at a later time. These licenses will be migratedlicense activation functionality over time to give you a certain degree of flexibility in how to migrate to these licenses in your network. Q. Cisco License Manager supports the Cisco ISR G2? A. Yes. Cisco License Manager supports the entire range of Cisco software activation features available on new routers. It is the easiest way to manage licenses in large networks and automate many of your daily activities. Cisco License Manager supports new integrated service routers from version 3.0. More information about Cisco License Manager is available at: Q. Does Cisco configuration engine support Cisco ISR G2? A. Yes. Cisco Configuration Engine supports additions to the portfolio of integrated service routers for the distribution and distribution of zero-touch configuration from version 3.0. 3.0. cisco 1941 series router configuration guide
