Gaf timberline shingle warranty form

I'm 65 and I have shingles on the side of my face. About 12 days ago, the left side of my face felt burned. Two days later I had horrible pain in my left temple until my butcher joint. I felt like I was hit by a 90 m fast ball. About two days later I noticed two blisters on the eyelid, then a small bladder in the middle of my forehead, then finally a redheaded rash type rocking on the bridge of my nose... Needless to say I went to the dentist thinking something happened to my jaw, then to the oral surgeon, finally to my family doctor who diagnosed me with punctures. He prescribed anti viral and gabapentine medicines. My "sister" are almost completely gone on day 5 of medicines, but the pain is still unbearable. Any other evidence of this kind of pain? All I've read says "burn" pain. I've got a burning pain on my zygoma, so the pain in my weaving is much worse than burning. My temple is so sensitive. How long does this last? I'm second guessing if this is really shingles. Shingles is a viral infection caused by the same virus - chicken-zoster - which causes smallpox. This virus can remain inactive in the body for decades. A person who had chicken pox as a child can get shingles from the same virus at the age of 60 or 70 years. This often-painful condition causes a rash that blister and feels pungent. Although not the danger of life, a burst of shingles can be very uncomfortable and can last for weeks. Shingles tends to hit those with weakened immune systems, such aspeople, those who are subjected to treatment for cancer, or people with chronic diseases or diseases that attack the immune system, such as HIV/AIDS. Symptoms of shingles include pungent pain on the skin that generally precedes a rash and bladders of several days and is usually the first indication of a shingles burst. Skin can also feel very sensitive to touch. Later, a rash develops, with painful bladders and full of fluids. Razzi on the face, especially on the nose, have a greater possibility to cause complications. Sparks can also cause itching of the skin, fever, headaches and fatigue. Common symptoms Skin Pain Skin SensitiveBlistering rashitchy skinFever, headache and fatigue Shingles is a condition that occurs in some people who have had Chickenpox. Both these conditions are caused by the Varicella Zoster virus (VZV). After a Polpo infection, the virus doesn't go away. Instead, it travels from the skin through the nerves to a bundle of nervous tissue near the spine. There the virus remains inactive and is asymptomatic until the circumstances cause the virus to reactivate. Shingles is very common, but not all those who had Chickenpox get it. You are at greater risk of getting Shingles if the immune system is suppressed (low). The main symptom of Shingles is a painful skin rash. Typically, it is on one side of the body in a linear distribution or on the face. The rash can be preceded by tingling, itching or pain, followed by blistersdisappear in a few days. The antiviral drug can be taken soon during the disease to reduce its length and severity. Treatment can also include painkillers medications and remedies such as Calamine lotion to relieve itching. Sparkling is a painful skin rash. It is also called zoster or herpes zoster. It is caused by the zoster chicken virus. This is the same virus that causes chickenpox. Almost a third of people in the United States will get shingles in their lives. Most people will only get it once. But some people can have more than one episode. The virus that causes shredding is not the same virus that causes oral or genital herpes. That virus is called herpes simplex virus. The two are in the same family of viruses. Sparks usually cause a painful and blistering rash. Sometimes pain, itching, or tingling begin a few days before the rash appears. The rash begins with reddish dossies. In a few days, these bumps turn into bladders filled with liquid. You might feel a sting or burning of pain. The rash could also itching. Other symptoms include: Fever Chills Nausea Diarrhea The headache glitter occurs more often on the trunk of the body. It also occurs on one side of the body. It could be a band of blisters around the back or chest. The bladders usually accumulate in about a week. The rash usually clears in 2 to 4 weeks. You can see changes in the color of your skin when the scams fall. In more severe cases of shingles, these color changesto be permanent. even if the shingles rash improves or goes away in a few weeks, the pain can last longer. this condition is known as post-herpetic nerve (phn.) in most people, however, shingles pain goes away in 1 to 2 months. shingles is caused by the zoster chicken virus, the same virus that causes the chickenpox. after you have had chickenpox, the virus goes dormant (inactive) in your body. remains in some nerve cells. your immune system keeps the virus in these cells. as you age, the immune system can become weaker. if this happens, the virus can reactivate, causing shingles. Many times this happens years after you had chickenpox. If you had the chickenpox vaccine, you're less likely to have the chickenpox. Therefore, you are less likely to develop later shingles. Most people who get shingles are more than 50 years of age or have a weak immune system. For example, you could get shingles if: do you have cancer taking drugs that weaken the immune system you have hiv or aids can give shingles to others? No one can take the creeps. but the virus can be spread to a person who has never had chickenpox. the virus lives in the blisters that you waste. can be diffused until the bladders are completely healed. If you have blisters who have not yet crusted, you should stay away from: anyone who has never had chicken chicks under 12 months pregnant women very sick people (like those with cancer or AIDS) tell your doctoryou live with children who did not have chickenpox. They may need to be vaccinated. The doctor will ask you your medical history, even if you've ever had chickenpox. he or she will also ask your symptoms. They will do a physical examination and inspect your rash. there is a test that can confirm shingles, but it is not normally necessary. the best way to prevent shredding is through vaccination. vaccinate your children for chickenpox. This vaccine reduces the risk of getting chickenpox. you can not get shingles unless you had the chickenpox before. When you're older, take the vaccine. it is recommended for adults 50 years of age and older. can prevent shredding. people who have gotten kicks should get the vaccine to help stop the disease to be replenished. common side effects of the vaccine are headaches, more redness, swelling, itching and pain at the injection site. the shingles vaccine is not recommended for anyone: it had an allergic reaction to jelly or neomycin antibiotic has an allergy to any component of the shingles vaccine has a weakened immune system due to conditions such as leukemia, hiv, or AIDS is getting treatment for cancer is treated with drugs that suppress their immune system, including high dose steroids is pregnant or could remain a few weeks ago. These drugs can reduce the severity and duration of symptoms.famciclovir, or valacyclovir are commonly prescribed. Your doctor will decide whether one of these drugs is right for you. These drugs work better if you start taking them in the first 3 days after you get the rash. Your physician might also have you take a steroid drug to reduce pain and swelling. This drug along with antiviral medication can reduce the risk of developing post-herpetic nerve. What can I do for pain? To help with the pain of the shredding, your doctor may be able to get you an over-the-counter pain medication. This could include acetaminophen (a brand: Tylenol) or ibuprofen (two brands: Motrin, Advil). The application of a medicated anti-itch lotion (two brands: Benadryl, Caladryl) to the bladders could reduce pain and itching. Placing the fresh compresses filled with water mixed with white vinegar on the bladders and sores could also help. If shredding causes severe pain, the doctor may prescribe a stronger pain medication. Most people will only get shingles once in their lives. Pain and rash resolve in 3-5 weeks, and bladders do not leave scars. There are some complications that may occur. The most common complication of shingles is post-herpetic neuralgia (PHN). This is when shingles pain lasts for a long time after the rash went. About 10% of people who have shingles will develop PHN. It is caused by damaged nerve fibers that send exaggerated pain messages from the skin to the brain. The oldest you are, most likelyare to develop PHN. It is also likely to be more severe when you are older. Scingles can also lead to a condition of the eye called herpes zoster ophthalmicus (HZO). HZO can cause a rash with small bladders to exit on the front and around the eye. Usually this happens only on one side of your face. Sometimes you will have pain in the same area of the face a few days before the epidemic. The infection of the eye causes extreme pain, swelling of the eyelid, light sensitivity and redness. In serious cases, cornea can be damaged. This can affect your vision. People with HZO should see a doctor right away. I got the chickenpox. Are they at risk of developing shredding? What is the best treatment for my shingles? The pain from shingles is not going away. What can I do to make myself more comfortable? I'm in treatment for shredding. When should I call my doctor if things don't improve? I have shingles and my kids didn't have the pox. Should I have her vaccinated? Is the crushing vaccine right for me? Are there any risks associated with the shredding vaccine? Will my post-herpetic nerve ever go away? If I've never had chickenpox, should I still get shingles vaccination?
