Eni s.p.a. - p.iva 00905811006 The failure and reversal movement is an important component of mountain formation. The mountain formation refers to the geological processes that underlie the formation of mountains. These processes are associated with large-scale crust movements (board plate). [1] Mountain formation is related to the tectimine plate. Folding, failure, volcanic activity, intrusion and metamorphism are all parts of the orogenic process of the mountain builder. [2] The understanding of the specific landscape characteristics in terms of the underlying tectimic processes is called tectile geomorphology, and the study of geologically young or in progress processes is called Neotectonics. [3] Types of mountains See also: Mountain Types List There are three major types of mountains: Volcanic, fold and block. [4] A more detailed classification is useful on local scale PRATE THE TECHNICABINA and adds to the above categories. [5] Volcanic mountains see also: Stratovolcano, Scield Volcano and Guyot Mount Baker, a stratovoltano in the northwest of Washington Mauna lava lava; A shield volcano. Technical plaque movements create vultures along the boundaries of the board, which shut down and form mountains. A volcanic arc system is a sane of volcanies that form near a subducted zone, where the crust of an oceanic board sinking melts. [7] Most volcanies occur in a band that surrounds the Pacific Ocean (the pacific fire ring), and in another that extends from the Mediterranean of the SIA to join the Pacific Band in the Indonà Lake Archip © Sio. The most important types of volcanic mountain are composite or stratovoltan (vesaxvio, kilimanjaro and mount fuji are examples) and shield vulture (such as Mauna Loa in Havaan, a hotspot volcano). [8] [9] A shield volcano has a gently inclined cone due to low viscosity of the materiel emitted, mainly basalt. Mauna Loa is the classic example, with a tilt of 4 ° -6 °. (The relationship between slope and viscosity under the theme of the resting angle. [10]) The composite volcano or stratovoltan has a more pronounced cone (33 ° -40 Å °). [11] Due to the greater viscosity of the material, and eruptions are more violent and less frequent than for the shield volcanos. Alemon of the examples already mentioned are Mount Shasta, Mount Hood and Mount Rainier. [12] stratovolcanoes associated with a (left) subduction and a spreading ridge volcano (right). A hotspot volcano is center. [6] Volcano elements in a volcanic arc system. BLACK MOUNTAINS Vamor also: Fold (geology), fold and push the belt and bend the Zard-Kuh mountain, a mountain folds in the central range of Iran Zagros. When the plates collide or submit to Subduction (this is - à ¢ à ¢ "ONE ride on another), the dishes tend to bend and bend, forming mountains. Most major chains of continental mountains are associated with The pushed and folding à ¢ æ
