How do i describe clouds

What words describe clouds. How to describe clouds in a storm. How do i describe grey clouds. How to describe clouds in the sky. How to describe beautiful clouds.

Cloud management: Software and technologies designed for operational and monitoring applications, data and services that reside in the cloud. Cloud management tools help ensure that cloud-based resources work optimally and interact with users and other services. Cloud Management Strategies Cloud strategy Management strategy typically involves numerous tasks, including performance monitoring (response, latency, free time, etc.), security and compliance verification and management, as well as disaster recovery and emergency plans. With the growth of a more complex cloud computing and a wide range of private, hybrid and public cloud-based systems and infrastructures already in use, a cloud management tool collection company must be as flexible and scalable as its cloud computing strategy. Where's your cloud and how do you handle it? I pass this question to an occasional CIO and get answers to the limit. Most don't yet use clouds but desire after them. Others exploit public clouds for unprivileged work and mission-acrylic. Very few have put together their private clouds (p-nubi). P clouds and rental clouds are similar to Sherman tanks and kangaroos. The promise of agile clouds is that you would be able to establish your own internal p-cloud and extended ad hoc to external cloud resources, rented. Currently this requires a considerable amount of handicraft engineering or adhesion to one or another public cloud tool and management protocols. Each approach is anathema for IT. All radical growth impulses in IT technologies occurred when open standards were spread. UNIX killed MPE, VMS and other trans. Linux is slowly killing UNIX owner and blocking the growth of the Windows server. TCP/IP and Berkeley Socketskilled Netware, Vines and a number of lazy competitors. x32 and x64 chips have all but eliminated SPARC, Itanium and other redheaded step kids. Standards Standards stuff happens because it invites commodification and interoperability, the first two wet dreams CIO. Not surprisingly, a number of smarter industry players are promoting cloud computing standards. When a document titled "Open Could Manifesto" is burned by IBM, Sun, VMware, Cisco, EMC, SAP, Advanced Micro Devices, Elastra, Akamai, Novell, Rackspace, RightScale and GoGrid, you realize that standards are important to both vendors and their customers. Oddly enough, HP and Microsoft are not on the list of signatories. The absence of Microsoft is understandable, as well as Amazon. Ballmer spectators launched Azure. In their effort to own everything, Microsoft doesn't want to be part of plans that commodify clouds. Amazon is like an understandable absent too. Having made popular the clouds that do not wish to diminish their advantage in the industry, HP is perplexed, however. The manifesto calls on providers to "ensure that the challenges of cloud adoption (security, integration, portability, interoperability, governance/management, measurement/monitoring) are addressed through open standards." HP has taken great advantage of standards, be it PCs, servers or the network management protocols that power their still very popular Openview suite. Perhaps HP was excluded from the manifest group because negotiations were underway on the merger between IBM and Sun. Nothing marginalizes a competitor as much as excluding it from a group of champions. In their trash the manifesto, Microsoft marginalized itself. The problem is that the manifesto is nothing more than a statement of desire "a letter of love to the market". It sets out high-level principles for cloud providers to adopt and little else. This is a threat rather than an action - a way to persuade competing suppliers to commit to open interoperability or to appear to the public as a company of Old school (from here the absence of Microsoft). Like other religions, articulates the noble goals through beautiful words. The decapitations come later. Opening the opening The website Manifesto is scarce more than a forum for discussion than an action focal point. Without action, without translating high-level wishes into concrete cloud interoperability, it is nothing more than a wonderful wiki. He hopes that IBM will buy Sun and promise it as a leader in open cloud technology, using the organisation of the Open Cloud Manifesto as an engineering epicenter at the next wave of IT infrastructure. Finally, a good use for Sun. Clouds have many effects on our climate, as well as throwing hail and covering us in snow. For example, they serve as barriers to heating that moves both inside and outside the Earth's atmosphere. Researchers estimate that the current effect of clouds on the atmosphere of our planet is to cool it slightly. This is, however, something that researchers are examining closely, in the context of efforts to gather information on possible climate change. Clouds generally affect temperature in two ways. Above the planet's surface, the clouds reflect about twenty percent of the heat coming into space [source: Tarbuck]. Clouds, water vapours and other atmospheric gases also absorb about twenty per cent of this incoming solar radiation. The low-level clouds reflect the highest amount of heat, and that is why we enjoy colder temperatures during a cloudy day. On the contrary, a cloudy night is hotter than a foggy night because © even clouds create a foggy effect. The clouds partially absorb the outgoing heat (such as the heat released in the evening, while the ground cools) and reabsorb some of the heat back to the Earth's surface. High-level clouds typically absorb this outgoing heat. Clouds regularly help to move dust, bacteria and other particles to the planet's surface. The clouds bring dust at a very rate faster than you think. An estimate puts the amount of dust that moves from Africa to a part of the Amazon basin in South America at about thirteen million tonnes annually [source: Phillips]. Unfortunately, too much dust in the atmosphere decrease the amount of rain that falls on a region. This is believed to be due to the fact that when raindrops are formed by a lot of nucleators, these drops grow smaller and are therefore less prone to fall. So, if a region has a lot of dust in the air, it will probably get less rain. This can contribute to desertification (where a local climate slowly changes in the desert) and is one of the factors that scientists believe are behind the changes in the landscape around Central Africa. You think we're done? We have not yet talked about some of the most interesting clouds of all, so go to the next page to learn all about them. Head to Clouds!f you like clouds, try the members of the Cloud Assessment Society for a serious devotion to clouds. Members have submitted more than three,000 cloud photos to their website. Some of these photos have also received the highest honor of the company: Cloud of the Month. This cloud site also contains news, poetry, art and more. Again.
