A, A, A, A, A, teaching and learning experience this program presents a better teaching and experience in fact of learning for you and your students. It provides: Database Design Methodology that can be used by technicians and non-technical readers a complete introduction to the theory behind Databases a clear presentation that supports Learningsamples asked questions in the 6th edition of the Systems database: you are asked by the general manager of Dream to investigate And report on the OLAP applicability for the organization. The report should describe technology and provide a comparison with traditional query and reporting tools of relational DBMS. The report should also identify the advantages and disadvantages, and the problem areas associated with the OLAP implementation. The report should reach a fully justified set of conclusions regarding the OLAP applicability for Dream .Using the rules for the consistency scheme given in Section 27.7.3 and the sample scheme indicated in Figure 27.13, in consideration each of the following changes It was what the effect of change should be at scheme: (a) adding an attribute to a class; (B) the elimination of an attribute from a class; (C) rename an attribute; (D) carry out a SUPERCLASS class of a class C; (E) the removal of a class s from the list of a class c superclasses; (F) the creation of a new class C; (G) elimination of a class; (H) The names of the modification classes. Figure 27.13 Example scheme is with a single and multiple inheritance.using the hotel scheme given at the beginning of the exercises at the end of chapter 4, determine if the following queries are semantically correct: (a) r.type select, from r.price camera R, Hotel H where R.HOTEL_NUMBER = H.HOTELNUMBER and H.HOTEL_NAME = A Grosvenor Hotela and R.Type> 100; (B) Select G.Guestno, G.Name from the Hotel H, Booking B, G WHERE H.HOTELNO = B.HOTELNO AND H.HOTELNAME = A Grosvenor Hotela; (C) Select R.ROOMNO, H.HOTELNO FROM THE HOTEL H, Book B, Room R where H.HOTELNO = B.HOTELNO AND H.HOTELNO = A-â21A-â and B.ROOMNO = R.ROOMNO AND TYPE = A SA and B.HOTEINO = A H22A; The following tables form a database held in a relational DBMS: . Hotel (, Hotel at the hotel name, city) Room (roomno hotel type, price) Booking (hotel, Guestno, Datefrom, Dateeto, Roomno) Huest (Guestno, name, guest, guestaddress), where hotel contains continues and hotel is the primary key; Room contains the details of the rooms for each hotel and (Roomno, Hotelno) is the primary key; Reservations contains the booking details and (Hotel, Guestno, Datefrom) is the primary key; Guest contains guest details and guestno is the primary key. Produce some sample tables for these relationships that respect the rules of relationship integrity. Suggest some general constraints that would be appropriate for this scheme.
