Alot Health > Wellness As you know, never stop taking medication without talking to a doctor first. Stopping some medications suddenly can have serious side effects. Often we just assume that the drugs we are taking are good for us. Our doctor told us to take them, right? You're smart to follow doctor's orders because they know your health better than anyone. Unfortunately, this does not mean that the drug is good in the long run. There are a lot of reasons why someone should at least ask the doctor's questions about what you are prescribed. Many doctors prescribe medications that are designed to be short-term, and a person who is taking them long-term can cause problems. Sometimes, you should ask for a different kind of medication than what you initially suggested. Remember, the world of science is always changing. There's always evidence being made and redeemed. We might realise tomorrow that what we consider good for us today may not be good for us in the long run. For instance, everybody smoked cigarettes. Now, we know that the small roll of tobacco is extremely dangerous for us. Our doctors do their best to stay on top of this research, but sometimes, there are many contradictory answers; other times, there is just too much for them to elaborate. Even those studies are not always accurate. Pharmaceutical companies who just want to make money out of you buying their drug for all your predictable future often sponsor studies. These studies cannot always be trusted to be impartial. After all, they sponsored studies that said opioids are good for us, but now we're facing an epidemic of opioid overdose. Suffice to say, there is a lot of digging that needs to be done if you want to take any medication for a long period of time. These are 22 medications we found that could be dangerous for you.
