Whether the internet has disappeared in your apartment or the laptop outdoors needs an internet connection, or bites your desktop LAN show - there are many situations where tetling from Android smartphone can be a rescue. Here, Giga we show how you share your cellular network or WLAN using a smartphone with other devices. Most Android smartphones offer several options such as computers, laptops, streaming memos, consoles and other devices for mobile data connection or wlan or modem or ". - Thering fastest and usually the safest option to connect your Android smartphone to the other device is via USB cable. Use USB to connect a cell phone to a device that uses the internet, then do the following: Go to the menu element element wireless connection and network (The network and the internet, etc.) In the next menu you will touch the Moderate Moderation of the mobile phone and the public internet access point (public internet access point and attachment or the like) Switch the slider to USB modem. The USB cord is at the ATTU finally the attraction also operates for many devices that use Bluetooth - with Bluetooth - with a condition that admission is nel Walks to connect to the Internet via Bluetooth. However, the wireless connection is the most dangerous choice for the most unsafe option and offers the lowest data permeability for many fans. To broadcast the Internet with a smartphone using Bluetooth, follow the following steps: Turn on Bluetooth on both devices and pair them, Purdish smartphone settings). Tetling using WlanalertatV hens tied but many devices can still be shared by mobile internet here because there is no WLAN module at the same timelf there is no Internet in your apartment, the laptop must be connected to the Internet on the street, or the mouse is connected to the LAN cabinet of your desktop computer: there are many situations where a modem with an Android smartphone can be a real firecracker. In the GIGA area, we show you how you can use your mobile phone or WLAN with other devices via smartphone. Most Android smartphones offer several ways to connect or "tether" PCs, laptops, streamers, consoles, and other devices with a cellular data connection or WLAN. Below we will tell you about three typical types of modems. USB Mode Mode A fast and secure way to use a modem between your Android smartphone and another device using a USB cable, including a Bluetooth modem. Connect your mobile phone to a device that requires internet via USB, then do the following: Open your smartphone's settings. Name the wireless menu and networks (network and internet or similar) menu. In the next menu, click on connection sharing, and portable access point (access point and modem or similar). Activate the USB modem cursor. The connected device should now indicate that a new Internet connection is available. Modem via Bluetooth. If you don't have a custom USB cable, the modem will work with many Bluetooth-enabled devices where the receiving device allows Internet connectivity via Bluetooth. However, wireless connectivity is often the least secure option and offers the least throughput in most cases. To share the Internet from your smartphone via Bluetooth, do this: activate Bluetooth on both devices and connect them to each other. Accesses smartphone settings. Click on the wireless menu and networks (Network and Internet or similar). In the next menu, press Modem and Portable Access Point (Access Points and Modem or similar). Activate the cursor for the Bluetooth modem. Security prompts (digital or similar code) may appear on connected devices. As an alternative to a regular modem, a WLAN modem, you can create a WLAN access point using your smartphone. However, here you can only share mobile internet with many devices, as the WLAN module can not be used simultaneously. It can be connected to the WLAN router and can transfer access. If you find Wi-Fi or Wi-Fi-Bridge in the connection settings, it has a double wifi smartphone and can be used as a WLAN relay. In this case, you can also place your Wi-Fi from your router via Wian. To use the WLAN attachment, follow the following: EU RISTROPUS SMARTFON. Tilt the wireless and network menu (network and Internet or similar). Or.) The names of hot spots (SSID) and password. The Wi-Fi-Bridge is now active. Now add to the wireless network from the second network and connect to previously defined password. Do you want to miss news about technology, city and pop culture? No current tests and instructions? Then follow us on Facebook or Twitter. As for Bluetooth, you can connect certain pixel devices via wirelessly. After the first double Bluetooth device, they can be automatically connected with another. If the smartphone is connected to another Bluetooth device, the Bluetooth symbol appears in the upper part of the screen. Important: some of these steps work only on Android 10 or more. Thus, you determine the Android version. On some of these steps, they should use the screen. Connection registration can only be performed on pixels. Activate or deactivate Bluetooth, wipe the upper edge of the screen. Click on "Bluetooth". Tip: You can protect the battery from Bluetooth deactivation when you do not use this functionality. Bluetooth is disconnected in flight mode. Step 1: Bluetooth-too Freethe is important: your device will remain connected until you separate them. Option 1: On the settings of the application (All Bluetooth-Zubeit) erase the upper edge of the screen. Leave the printed Bluetooth. Click on a new device. If mating is not displayed, look at the "correspondence device" or click Plus. Click in the name of the Bluetooth device that you associate with the deviceFollow the instructions on the screen. Advice. If you need a security code, but don't have one, try to enter "0000" or "1234". These are the most common security codes. Option 2. With regard to the notification (only for Quick interface accessories), the following requirements must be met: The Bluetooth accessories support the Quick value function. In the case of ingredients that promote quick conjugation, this is given on the packaging. Many are also marked with "Google" or "Made for Google". Find accessories in the Google Store on your smartphone. Turn on the accessories and put it into coupling mode. The accessories should be near your smartphone or tablet. When you get the message, click on the bar to create a couple. You will then receive a "Device Connected" or "Conjugation Complete" message. If your add-on has to be configured, a "Set up now" is displayed. Advice. If you have not received the notification, open the "Settings" on your smartphone and tap on "connected devices". In the Device section, tap the device with which you want to conjugate. For more information, see accessories using Quick Pairing. Step 2. Remove the connection from the upper edge of the screen. Bluetooth should be activated. Type and hold Bluetooth. In the list of conjugated devices, click on a conjugated but not connected device. Your smartphone is connected to a Bluetooth device. This device is displayed as "connected" in the list. Setting, separating or searching of a Bluetooth accessories separates a Bluetooth accessories or names it and strokes the top of the screen to select actions. Type and hold Bluetooth. If the add-on is listed under "Available multimedia devices", click "Settings" next to the device name. If you do not see add-ons in the "Recently connected devices" area, assign them to "all ads". In addition to the add-on name, click on "Settings". Make the necessary changes: Change the name of the appendix: Click "Change" above. Separate: Click "Connect". Complete the device on your phone: Press Delete. You can activate or deactivate other settings on some devices. Tips: On a tablet shared by different people, all these people can change the overall Bluetooth parameters. Change your phone or tablet Bluetooth name by sweeping the screen from the top down. Bluetooth must be activated. Press and hold "Bluetooth". Press the name of the device. If you do not see the name of the device, press more to rename this device. Enter a new word. Rename the press. Look for accessories using an important quick torque feature: Using a quick torque function, Bluetooth accessories are related to your Google Account. Other connected devices can detect newly discovered accessories and automatically combine them with accessories. Open your smartphone settings. Press Google devices and share registered devices. Tip: If you want to automatically register your devices, activate the option automatically registers the device. Google collects some information to quickly combine Bluetooth devices with your Google Account configured. Some of these features use Google Play services. Some of the things that collect a quick connection are the following personal information on certain features, such as the name that gives a Bluetooth device during the performance configuration and uses data for the analysis disabled. Quick connecting data collected during rapid connection is encrypted during transmission. This data can be deleted if they deactivate a quick connection. Open your smartphone settings. Press Google devices and share registered devices. Learn more to solve Bluetooth problems to share a mobile connection using Bluetooth How can we improve this site? Press the settings on your phone> activate Bluetooth. Then activate the Wi-Fi access point. Open the Bluetooth manager on the PC and select the option to connect the device. Combine your phone when it appears. Under Windows, open devices and printers. -Gread directly by phone> Connect with> access point. This article explains how to access the Internet using a computer -connected Bluetooth compatible mobile phone.As a modem for accessing the internet on your laptop, your mobile phone with Bluetooth is ideal if there is no WLAN service or if your usual internet service fails. However, all data downloaded and uploaded on the laptop uses your phone's data plan. Monitor your data usage to avoid unexpected charges or data caps. In this method, your phone is connected to your computer and connected via a personal area network (PAN). Activate Bluetooth on your phone (usually in the settings menu) and make your phone discoverable or visible to other Bluetooth devices. If you're using an iPhone, turn on Bluetooth in Settings > Bluetooth. Android devices enable Bluetooth via the drop-down menu at the top of the screen. Open the menu and tap on the Bluetooth symbol. Turn on your phone's hotspot feature so that your laptop can access the Internet whenever it's connected to your phone. Enable Personal Hotspot in the Settings app on your iPhone. The WLAN hotspot option on Android devices is located in Network & Internet settings. If you can't find it, look for hotspot or wires in the settings. Open the Bluetooth Manager application on your computer. Open the dialog box in Windows by pressing Win + R and type bluetoothctl control to open Bluetooth settings. On a Mac, click the Bluetooth icon at the top of the screen and select Bluetooth. If you don't see this option, go to System Settings > Bluetooth and enable the Bluetooth option in the menu. In the Bluetooth manager, select the option to add a new connection or a new device so that the computer searches for available Bluetooth devices and finds the phone. In Windows 10, this option means something like Bluetooth or another device. Go to System Preferences on your Mac, then Bluetooth. If your phone appears on the next screen, select it and pair it with your laptop. You may need to select it and click a button or log in. You will be prompted to enter a pin, something on your laptop, or try standard pins like 0000 or 1234, or check your device's manual. Click below for multiple operating systems, e.g. B. Windows connects as right-click and device access point. Enable devices and printers in the management system, right-click on the phone

and select > Connect to Access Point. You may also be prompted to select the service you are connecting to. In this case, select Pan (personal space), matingiPhone to your Windows 10 computer. If you can't find Bluetooth Manager, try to find a Bluetooth program using a search tool on your computer because you may be unknowingly using special Bluetooth software. If your laptop doesn't prompt you for the type of service you want to use with Bluetooth, try finding that setting in the Bluetooth option menu. It only takes a few things to get a laptop with internet from your phone: Bluetooth adapter Bluetooth phone Bluetooth (built-in or external dongle) There are two alternatives for this method of charging your notebook data from your mobile operator. Including using the Bluetooth dial-up network and connecting to your wireless service provider to connect your phone to your computer. However, the easiest way may be to use tethering software, such as Pdanet for smartphones or synccl for regular phones, as these apps don't require many settings changes or technology knowledge from your provider. !
