Tutorial

React native video controls android. React native android app example. React-native-video-controls example. React native video not working on android. React android app example.

Version 6.x recommends react-native >= 0.68.2. For older versions of react-native, please use version 5.x. Version 6.0.0 breaking changes Version 6.0.0 is introducing dozens of breaking changes, mostly through updated dependencies and significant refactoring. While the API remains compatible, the significant internal changes require full testing with your app to ensure all functionality remains operational. Please view the Changelog for specific breaking changes. Useful resources Documentation Changelog Contribution guide react-native-video was originally created by Brent Vatne This is an example of React Native Video to Play Any Video in Android and IOS. There are many libraries available to play any video in React Native but React Native Video is very good and widely accepted by react-native-community members so I personally like to use it. React Native Video provides all the props which you need while playing a video and we can control them easily. React Native Video does not provide the inbuilt controls to play /Pause or Seek the video as they have provided the props for the full access. If you are interested to design your own controls then your welcome else you can use a supporting library called react-native-media-controls. It provides you all the functional controls which you need for a standard video player. Loading Overlay Play / Pause Seek FullScreen To Play a Video in React Native To play a video in React Native we are going to use Video and MediaControls components from react-native-video and react-native-media-controls libraries. Video component (this.videoPlayer = videoPlayer) resizeMode={this.state.screenType} onFullScreen={this.state.isFullScreen} source={{uri: ' '}} style={styles.mediaPlayer} volume={10} /> MediaControls Component For this example, We are going to play a simple video with MediaControls. So let's get started. To Make a React Native App Getting started with React Native will help you to know more about the way you can make a React Native project. We are going to use react-native init to make our React Native App. Assuming that you have node installed, you can use npm to install the react-native-cli command line utility. Open the terminal and go to the workspace and run npm install -g react-native-cli Run the following commands to create a new React Native project react-native init ProjectName If you want to start a new project with a specific React Native version, you can use the --version argument: react-native init ProjectName --version X.XX.X react-native init ProjectName --version react-native@next This will make a project structure with an index file named App.js in your project directory. Installation of Dependencies To use Video and MediaControls we need to install react-native-video and react-native-media-controls dependencies. To install this open the terminal and jump into your project using cd ProjectName Run the following command to install npm install --save react-native-video npm install --save react-native-media-controls npm install --save react-native-slider This command will copy all the dependency into your node_module directory. CocoaPods Installation After the update of React Native 0.60, they have introduced autolinking so we do not require to link the library but need to install pods. So to install pods use cd ios && pod install && cd .. Code Now Open App.js in any code editor and replace the code with the following code App.js // React Native Video Library to Play Video in Android and IOS // import React from 'react'; // import React from 'react'; // import all the components we are going to use import {SafeAreaView, StyleSheet, Text, View} from 'react-native'; //Import React Native Video to play video import Video from 'react-native-video'; //Media Controls to control Play/Pause/Seek and Full screen import MediaControls, {PLAYER_STATES} from 'react-native-media-controls'; const App = () => { const videoPlayer = useRef(null); const [currentTime, setCurrentTime] = useState(0); const [duration, setDuration] = useState(0); const [isFullScreen, setIsFullScreen] = useState(false); const [isLoading, setIsLoading] = useState(true); const [paused, setPaused] = useState(false); const [playerState, setPlayerState] = useState(PLAYER_STATES.PLAYING); const [screenType, setScreenType] = useState('content'); const onSeek = (seek) => { //Handler for change in seekbar videoPlayer.current.seek(seek); }; const onPause = (playerState) => { //Handler for Video Pause setPaused(paused); setPlayerState(playerState); }; const onReplay = () => { //Handler for Replay setPlayerState(PLAYER_STATES.PLAYING); videoPlayer.current.seek(0); }; const onProgress = (data) => { // Video Player will progress continue even if it ends if (!isLoading && playerState !== PLAYER_STATES.ENDED) { setCurrentTime(data.currentTime); } }; const onLoad = (data) => { setDuration(data.duration); setIsLoading(false); }; const onLoadStart = (data) => setIsLoading(true); const onEnd = () => setPlayerState(PLAYER_STATES.ENDED); const onError = () => alert('Oh! ', error); const exitFullScreen = () => { alert('Exit full screen'); }; const enterFullScreen = () => { }; const onFullScreen = () => { setIsFullScreen(isFullScreen); if (screenType === 'content') setScreenType('cover'); else setScreenType('content'); }; const renderToolbar = () => (toolbar); const onSeeking = (currentTime) => setCurrentTime(currentTime); return (
